HYPERON HADRONS

5-11 June 2022 AGH-UST Kraków, Poland

Overview

Vector-like quarks

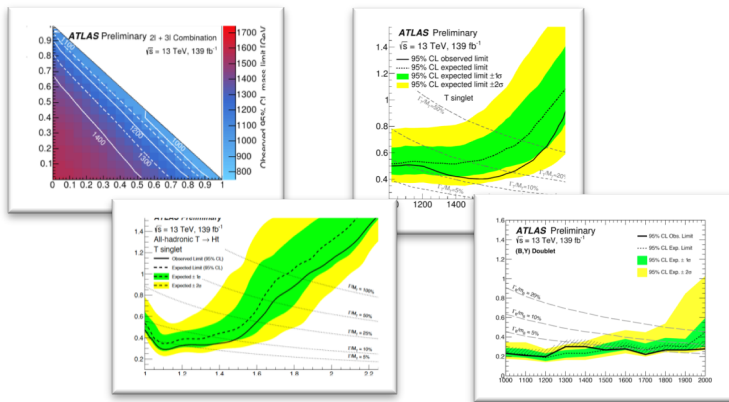

- What are they?
- Why should you care?
- What do they look like?
- Previous Results (36.1 fb⁻¹)

Improved techniques

- Top-Tagging
- b-Tagging

Results using Full Run 2 Dataset (139 fb⁻¹)

- $T \rightarrow Zt + X$, with $Z \rightarrow \ell\ell$
- $T \rightarrow Ht/Zt$, with $t \rightarrow l\nu b$
- $T \rightarrow Ht$ with hadronic final state
- $B \rightarrow Hb$, with $H \rightarrow bb$

Conclusion

Vector-like Quarks

“Quarks”: Color-triplet, spin- $\frac{1}{2}$ particles

“Vector-like”: Left and right chiralities have the same weak isospin

- Weak current is vector-like:

VLQs:	$(\bar{Q}\gamma^\mu Q')$	SM quarks:	$(\bar{q}\gamma^\mu(1 - \gamma^5)q')$
-------	--------------------------	------------	---------------------------------------
- Can have bare VLQ mass term
 \Rightarrow Avoids constraints from Higgs measurements

Couple to SM through mixing with SM quarks

Naturalness + FCNC constraints \Rightarrow mixing mostly with 3rd generation

	Q[e]	singlets	VLQs			triplets
			doublets			
Top-partner $T \rightarrow$	5/3		$\begin{pmatrix} X \\ T \end{pmatrix}$			$\begin{pmatrix} X \\ T \end{pmatrix}$
Bottom-partner $B \rightarrow$	2/3	(T)		$\begin{pmatrix} T \\ B \end{pmatrix}$		$\begin{pmatrix} T \\ B \end{pmatrix}$
	-1/3	(B)		$\begin{pmatrix} B \\ Y \end{pmatrix}$		$\begin{pmatrix} B \\ Y \end{pmatrix}$
	-4/3					$\begin{pmatrix} Y \end{pmatrix}$

	$-\frac{4}{3}$					$\begin{pmatrix} Y \end{pmatrix}$

Naturalness

What is naturalness?

If X is an observable that depends on n independent inputs, a_i :

$$X = a_1 + a_2 + \dots + a_n$$

It would be unnatural to have some $|a_i| \gg |X|$

Natural:

$$a_1 = 4$$

$$a_2 = 2,098,572,309,800$$

$$a_3 = -1,099,785$$

$$\Rightarrow X = 2,098,571,210,019$$

Unnatural:

$$a_1 = 4$$

$$a_2 = 2,098,572,309,800$$

$$a_3 = -2,098,572,309,885$$

$$\Rightarrow X = -81$$

Naturalness

What is naturalness?

If X is an observable that depends on n independent inputs, a_i :

$$X = a_1 + a_2 + \dots + a_n$$

It would be unnatural to have some $|a_i| \gg |X|$

Natural:

$$a_1 = 4$$

$$a_2 = 2,098,572,309,800$$

$$a_3 = -1,099,785$$

$$\Rightarrow X = 2,098,571,210,019$$

Unnatural:

$$a_1 = 4$$

$$a_2 = 2,098,572,309,800$$

$$a_3 = -2,098,572,309,885$$

$$\Rightarrow X = -81$$

The “Hierarchy Problem”

The mass (squared) of the Higgs gets quantum corrections from interacting with other particles: $M_H^2 = 2\mu^2 + (\delta m_1)^2 + (\delta m_2)^2 + \dots$

The most significant correction comes from top quarks, which causes a quadratic divergence!

- If the SM is correct up to the Planck scale

$$M_H^2 = \overset{\text{“bare mass”}}{3.2734594296342905438674964732159643} - \overset{\text{quantum corrections, e.g.}}{3.2734594296342905438674964732159645} = 10^{-32} \text{ (in planck units)}$$

from
Roni Harnik

Having vector-like quarks could naturally cancel the divergent top correction!

- Adding a ~400 GeV vector-like top (T):

$$M_H^2 \sim 10 - 9 = 1 \text{ (in units of } \sim 100 \text{ GeV squared)}$$

- Thus, VLQs show up in many BSM scenarios
 - Little/Composite Higgs, Topcolor, GUTs, ...
- **And naturalness requires mass ~1 TeV ⇒ Accessible at the LHC!**

The "Hierarchy Problem"

What do we look for?

Pair Production:

- Via QCD \Rightarrow Depends only on VLQ mass
(Model-independent)

Single production:

- Via mixing with SM quarks \Rightarrow Depends on mass and coupling (κ)
- **Could dominate** for large VLQ masses

Decays:

- Dictated by quantum numbers
 - $T \rightarrow Wb, Zt, Ht$
 - $B \rightarrow Wt, Zb, Hb$
- Branching ratios depend on model/representation
 - $(T), (T,B), (X,T), (X,T,B), \text{ etc.}$

General Strategy

Multiple analyses to target each decay:

Test all possible branching ratios:

Previous Results (36.1 fb^{-1})

Heavy Objects

With
low- p_T :

high- p_T :
(boosted)

Heavy Objects

With
low- p_T :

high- p_T :
(boosted)

top-tagging

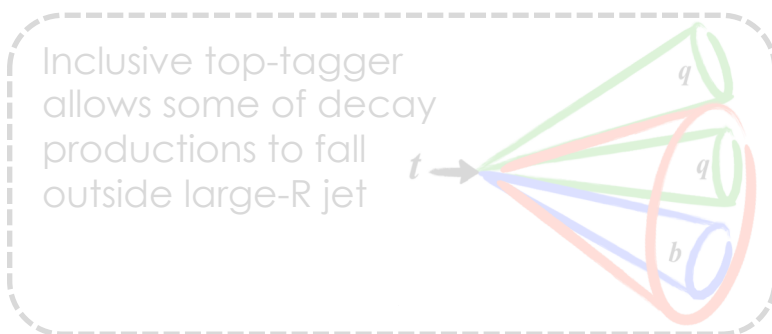

Identify high- p_T **top** quarks (“boosted-tops”)

- Large-radius jet with highly collimated sub-jets, including one b-jet

⇒ Deep Neural Network top-tagger

- Uses kinematics (jet mass, p_T , etc.) and dispersion of jet constituents (N-subjettiness, splitting scales, and energy correlation functions)

top-tagging

Identify high- p_T **top** quarks (“boosted-tops”)

- Large-radius jet with highly collimated sub-jets, including one b-jet

⇒ Deep Neural Network top-tagger

- Uses kinematics (jet mass, p_T , etc.) and dispersion of jet constituents (N-subjettiness, splitting scales, and energy correlation functions)

top-tagging

Identify high- p_T **top** quarks (“boosted-tops”)

- Large-radius jet with highly collimated sub-jets, including one b-jet

⇒ Deep Neural Network top-tagger

- Uses kinematics (jet mass, p_T , etc.) and dispersion of jet constituents (N-subjettiness, splitting scales, and energy correlation functions)

(Some analyses define their own custom taggers, but idea is the same)

b-tagging

Final states with (multiple) **bottom** quarks

Small-R jet with displaced secondary vertex, high mass, and high track multiplicity

⇒ Train **Deep Neural Network** b-tagger

- Dedicated b-taggers for different jet reconstruction algorithms
 - Particle Flow Jets
 - Variable-Radius Track Jets
- Uses previous inputs, plus **recurrent neural network** to exploit correlations between tracks
 - >50% better rejection w.r.t. **Boosted Decision Tree**

$TT \rightarrow Zt + X$, with $Z \rightarrow \ell\ell$

Example of trilepton decay:

$TT \rightarrow Zt + X$, with $Z \rightarrow \ell\ell$

Independently optimized for
dilepton and **trilepton** final states

DNN “multi-class boosted object
 tagger” (MCBOT) trained to identify
large-R jets from hadronically decaying top, V, H

Example of
 trilepton decay:

$TT \rightarrow Zt + X$, with $Z \rightarrow \ell\ell$

Independently optimized for
dilepton and trilepton final states

DNN “multi-class boosted object
tagger” (MCBOT) trained to identify
large-R jets from hadronically decaying top, V, H

Example of
trilepton decay:

Define 22 exclusive categories based on kinematic properties, b-tag and MCBOT

$TT \rightarrow Zt + X$, with $Z \rightarrow \ell\ell$

Independently optimized for dilepton and trilepton final states

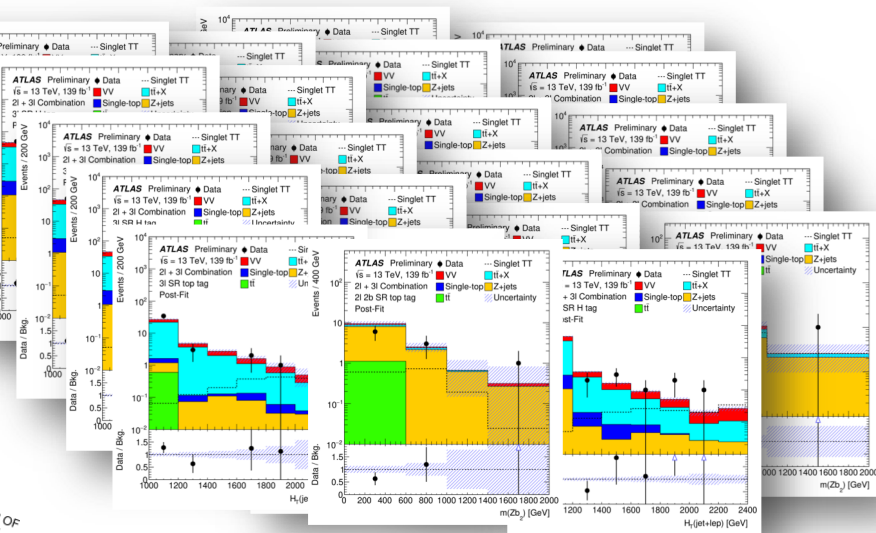

DNN “multi-class boosted object tagger” (MCBOT) trained to identify large-R jets from hadronically decaying top, V, H

Define 22 exclusive categories based on kinematic properties, b-tag and MCBOT

Example of trilepton decay:

- Simultaneous fit of discriminant distributions in each region

$TT \rightarrow Zt + X$, with $Z \rightarrow \ell\ell$

Analyze full Run 2 ATLAS dataset (139fb^{-1})

- Sensitivity limited by statistical uncertainties
- No deviations from the background-only model observed

⇒ Limits on cross-section vs. VLQ mass for **benchmark** scenarios

$TT \rightarrow Zt + X$, with $Z \rightarrow \ell\ell$

Analyze full Run 2 ATLAS dataset (139fb^{-1})

- Sensitivity limited by statistical uncertainties
- No deviations from the background-only model observed

⇒ Limits on cross-section vs. VLQ mass for **benchmark** scenarios

⇒ **Model-independent limits** on VLQ mass vs. branching ratio:

Extends the excluded B & T mass limits by more than 200 GeV compared to previous analysis using 2015+16 data (36fb^{-1})

$T \rightarrow Ht/Zt$, with $t \rightarrow l\nu b$

Leptonic top: High- p_T e/μ + E_T^{miss} + b-jet

Boosted H or Z: Small-R jets "re-clustered" into **Large-R** jets

- Tag as H, V, or top based on jet mass, p_T and number of sub-jets

Sensitivity limited by modeling uncertainties on dominant $t\bar{t}$ and single top backgrounds

- Data-driven kinematic reweighting for $t\bar{t}$ & tW and V +jets

Divide events into 24 regions based on number of **jets**, **b-tags**, **H**, **V**, & **top-tags**

Perform combined fit to discriminating variable in all regions

$T \rightarrow Ht/Zt$, with $t \rightarrow l\nu b$

Leptonic top: High- p_T $e/\mu + E_T^{\text{miss}} + b$ -jet

Boosted H or Z: Small-R jets "re-clustered" into **Large-R jet**

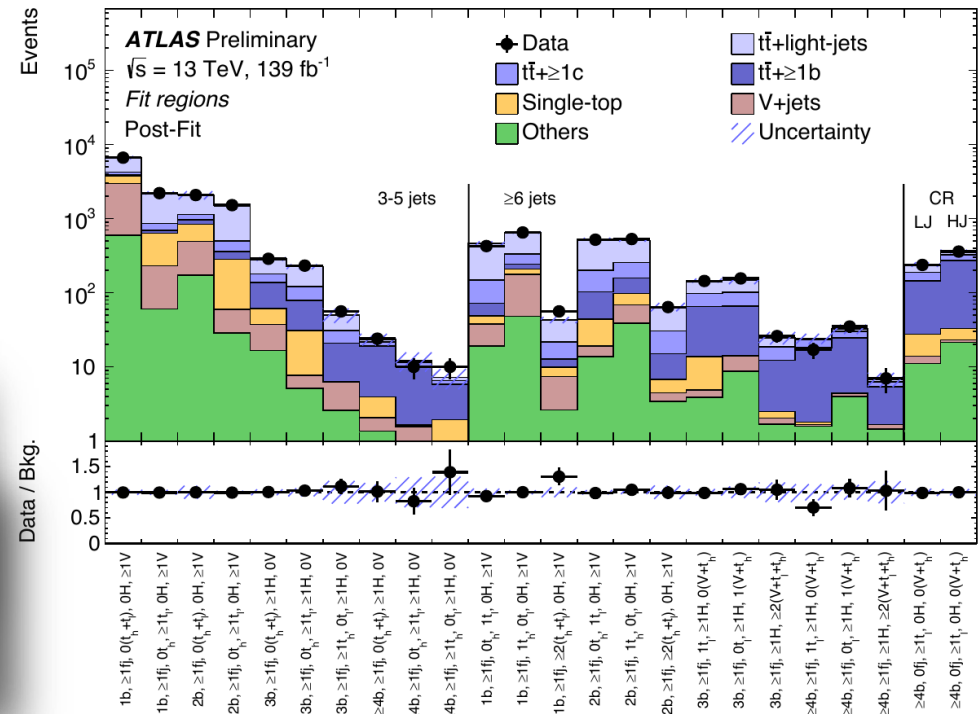

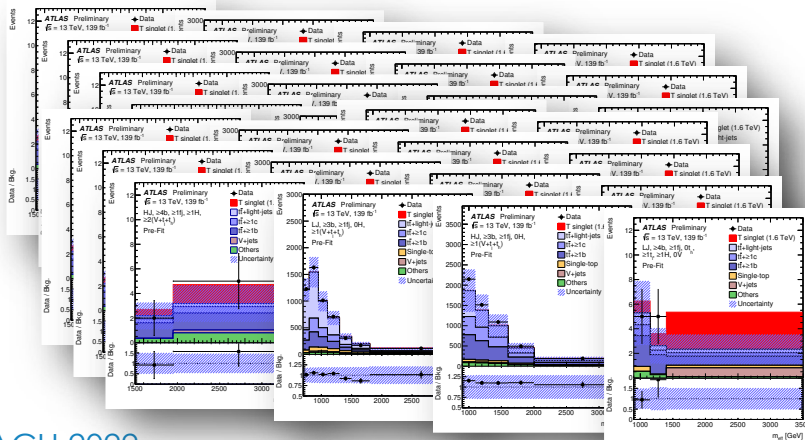

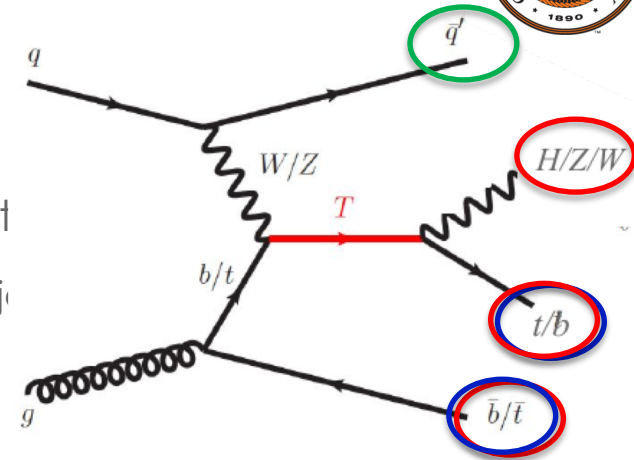

- Tag as H, V, or top based on jet mass, p_T and number of sub-jets

Sensitivity limited by modeling uncertainties on dominant $t\bar{t}$ and single top backgrounds

- Data-driven kinematic reweighting for $t\bar{t}$ & tW and V +jets

Divide events into 24 regions based on number of **jets**, **b-tags**, **H, V, & top-tags**

Perform combined fit to discriminating variable in all regions

$T \rightarrow Ht/Zt$, with $t \rightarrow l\nu b$

Analyze full Run 2 ATLAS data set (139 fb⁻¹)

No deviation from the background-only hypothesis

⇒ Set limits on singlet T as a function of mass m_T and coupling constant κ

$T \rightarrow Ht/Zt$, with $t \rightarrow l\nu b$

Analyze full Run 2 ATLAS data set (139 fb⁻¹)

No deviation from the background-only hypothesis

⇒ Set limits on singlet T as a function of mass m_T and coupling constant κ

$T \rightarrow Ht$ with hadronic final state

$T \rightarrow Ht$ with $H \rightarrow bb$ and $t \rightarrow qqb$

- 2 high- p_T large- R jets with b-subjets

Dominant background from QCD multijet events

- Estimate from data using an extension of the “ABCD” method
- 2D grid based on the tagging of the two large- R jets
 - Higgs or top tag
 - Number of b-tagged VTrack jets inside large- R jet

$$N_A = N_B \times \frac{N_C}{N_D}$$

$T \rightarrow Ht$ with hadronic final state

$T \rightarrow Ht$ with $H \rightarrow bb$ and $t \rightarrow qqb$

- 2 high- p_T large- R jets with b-subjets

Dominant background from QCD multijet events

- Estimate from data using an extension of the “ABCD” method
- 2D grid based on the tagging of the two large- R jets
 - Higgs or top tag
 - Number of b-tagged VRTrack jets inside large- R jet

Second-leading large- R jet tagging state	1t 0H $\geq 2b$			VR8		NR		SR	NR

$T \rightarrow Ht$ with hadronic final state

Simultaneous fit of dijet mass distribution in SR and NR

- Fit of signal cross section and normalization of $t\bar{t}$ background

Set limit as a function of the T mass m_T and coupling κ

\Rightarrow Exclude couplings above $\kappa \approx 0.4$ for low VLQ masses ($m_T \lesssim 1.5$ TeV)

$T \rightarrow Ht$ with hadronic final state

Simultaneous fit of dijet mass distribution in SR and NR

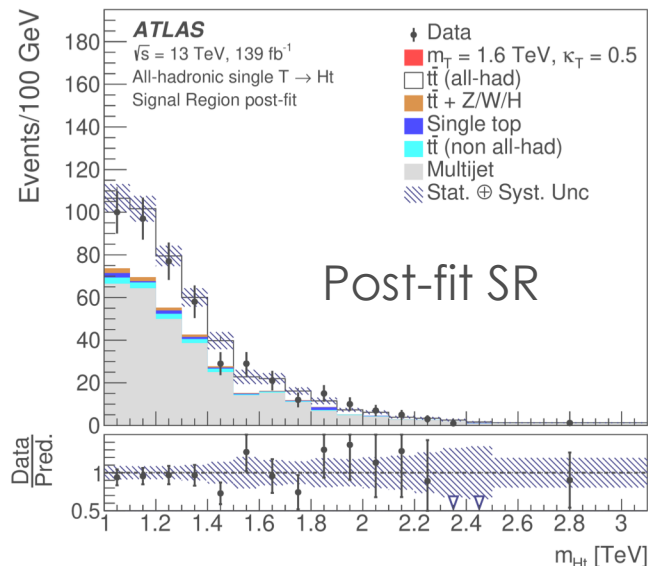

- Fit of signal cross section and normalization of $t\bar{t}$ background

Set limit as a function of the T mass m_T and coupling κ

\Rightarrow Exclude couplings above $\kappa \approx 0.4$ for low VLQ masses ($m_T \lesssim 1.5$ TeV)

Sensitivity gains from improved multijet estimation, jet tagging, and exploitation of boosted topologies.

$B \rightarrow Hb$, with $H \rightarrow bb$

Require 3 b-tagged small-R jets

⇒ Critical to reduce dominant multijet background

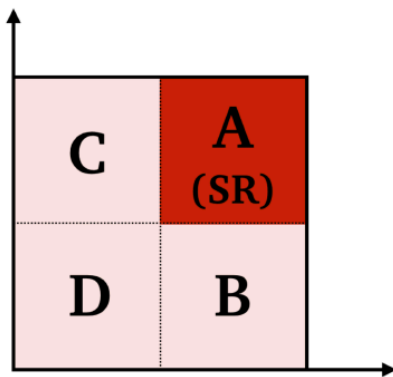

Identify boosted $H \rightarrow bb$

⇒ Large-R jet with mass $\approx m_H$ & contains 2 b-tagged track jets

Purely data-driven background estimate using “ABCD” method

- Extrapolate background from control region (B) to search region (A) using transfer functions measured in neighboring regions (C/D)

$$N_A = N_B \times \frac{N_C}{N_D}$$

$B \rightarrow Hb$, with $H \rightarrow b\bar{b}$

Binned maximum-likelihood fit to reconstructed B mass distribution m_B

No significant excesses found in full Run 2 dataset

⇒ Set limits on coupling and as a function of the VLB mass:

Significantly extended B parameter space being probed (previous limits: for (B,Y) doublet scenario @1.2TeV)

Conclusion

Many recent results from searches for vector-like partners to top and bottom quarks using ATLAS Run 2 data

- Significant improvements in sensitivity provided by new b- and top-tagging techniques
- Also improved background modeling

Unfortunately, still no signs of new physics...

But more Run 2 analyses coming soon!

... And Run 3 just around the corner!!!
